CRYSTAL LAKE PUBLIC BEACH CLOSED DUE TO ELEVATED E. COLI LEVELS

Manchester, NH – The Manchester Health Department announced today that the public beach at Crystal Lake is closed to swimming due to elevated levels of E.coli bacteria. The elevated bacteria levels were identified in water samples taken on Monday, August 10, 2020. Water samples taken at other locations on Crystal Lake did not find elevated levels of E. coli bacteria.

The Health Department has re-sampled the area and results from those samples are expected on Wednesday, August 12, 2020. Once E. coli levels are found to be acceptable, the public beach will be re-opened for swimming. The Department will issue a press release when the results are available.

Weekly water sample results are available at:
