

Snapshots of Social and Economic Well-Being by Race and Ethnicity in our Community

"Only by honestly confronting the walls that continue to separate us, can we break down those walls and move closer to creating a community in which we recognize diversity as a source of strength rather than a cause of division." — William Jefferson Clinton

RA

This report card is intended to document and describe current differences in social and economic well-being between the rapidly growing populations in our community. It has been produced for the Centers for Disease Control and Prevention NH REACH 2010 Initiative (Racial and Ethnic Approaches to Community Health) by the City of Manchester Department of Health and is designed to further one of the goals of the NH REACH 2010 Initiative: to educate people about the facts surrounding the issue of race and ethnicity in our community. This expanded Manchester-specific report card was closely modeled after the 1998 national paper entitled, "Changing America: Indicators of Social and Economic Well-being by Race and Hispanic Origin" by the Council of Economic Advisers for the President's Initiative on Race. By providing much needed information about racial disparities, this statistical report card provides the basis for an informed discussion about the problems faced by people of different races and backgrounds and, ultimately, for concrete action toward equal opportunity for all people by all people in Manchester, NH.

As one of the larger growing urban cities in northern New England, the U.S. Census reports that the population of the City of Manchester in 2000 was 107,006, up 7.5% from the 1990 Census. The population of the Manchester Health Service Area (HSA), which includes Manchester and eight surrounding towns, was 174,131, up 14.5% from the 1990 Census. The city economy is a diverse combination of manufacturing, service, and retail firms. About 62% of the population of NH lie within 30 miles or an estimated 35 minute commute of Manchester. The largest airport in NH is also located in the city. There are 15 elementary schools, 4 middle schools, and 3 high schools within the Manchester public school system, and nearly 8,000 college students study at seven Manchester area post-secondary institutions. All these combined makes Manchester and surrounding areas an attractive place to live and work, thereby drawing many. As the population grows, bringing greater diversity, Manchester and surrounding towns will increasingly experience the successes and challenges that come with an evolving community.

The tables and charts included in this report card highlight key indicators of well-being in five broad categories: population, labor markets, economic status, housing and neighborhoods, and enabling factors that include immigration status, education, access to health care, and transportation. Data by geographic local is provided for the United States, New Hampshire, Hillsborough County, Manchester Health Service Areas (HSA), city of Manchester, and city of Nashua in the section entitled, 'Tabular Appendix.' Towns included in the Manchester HSA are Auburn, Bedford, Candia, Chester, Deerfield, Goffstown, Hooksett, Manchester, and New Boston. This information provides a benchmark for measuring local quality of life and highlights potential areas for reducing disparities in well-being across racial and ethnic groups. The indicators were selected on the basis of their importance for economic and social wellbeing, as well as the quality and availability of data. While this report card cannot encompass all important aspects of social and economic life, it provides a place to begin.

Despite tremendous progress in education, health and longevity, and economic advancement in the past 50 years since the civil rights movement, disparities between racial and ethnic groups continue to persist. People continue to suffer disproportionate disadvantages in material and physical well-being and also in opportunity as evident in the data presented in this report card.

The classification of individuals by race and ethnicity remains a complex and controversial undertaking. The concepts of race and ethnicity lack precise and universally accepted definitions. Economic and social significance depends on a variety of factors, including how individuals identify themselves racially or ethnically and how others identify and treat them. Most of the data collected by Federal statistical agencies are classified by self-reported race and ethnicity through household surveys and the decennial censuses, in which respondents are asked to identify their race in one question and whether or not they are of Hispanic or Latino origin in a separate question. The accuracy and quality of the information collected is only as good as that offered by the respondent that participates in the survey. In this document, categories of race and ethnicity are labeled as they were labeled at the time the data was collected.

I. Population:

With an increased share of New Hampshire and Manchester population identifying with minority racial and ethnic groups, Manchester, and even the state of NH, is growing and its residents becoming more diverse. People of different races, nationalities, political, economic, and religious backgrounds come in search of better educational and work opportunities, to have a better quality of life, and a safer, healthier environment in which to raise their families.

	NH (1990)	NH (2000)	% Change	Manchester (1990)	Manchester (2000)	% Change
Total	1,109,252	1,235,786	11.4%	99,567	107,006	7.5%
White Alone, Not Hispanic	1,079,323	1,175,083	8.9%	95,105	95,663	0.6%
Black or African American Alone	6,628	8,293	25.1%	841	2,163	157.2%
American Indian and Alaska Native (AIAN) Alone	2,336	2,530	8.3%	240	316	31.7%
Asian or Native Hawaiian and Other Pacific Islander (NHPI) Alone	8,911	15,597	75.0%	1,182	2,275	92.5%
Hispanic or Latino	11,558	19,910	72.3%	2,142	4,840	126.0%

Racial and Ethnic Population Growth Between 1990 and 2000 for NH and Manchester¹

The 'Black or African American Alone' population grew by 157.2 percent between 1990 and 2000 in Manchester while the 'Hispanic or Latino' population grew by 126.0 percent. Growth in these two populations is dramatic in Manchester, especially when compared to populations for the entire state of New Hampshire.

In Nashua, the 'Asian Alone' populations grew by 130.2 percent between 1990 and 2000 while the city of Nashua grew by 8.7 percent.

Racial and Ethnic Composition for the Total Population and the Population Under 18 Years of Age for NH and Manchester^{2,3}

	NH (2000)	% of Total Population	% of Popula- tion Under 18 Years	Manchester (2000)	% of Total Population	% of Popula- tion Under 18 Years	Nashua (2000)	% of Total Population	% of Population Under 18 Years
Total	1,235,786			107,006			86,605		
White Alone, Not Hispanic	1,175,252	95.1%	93.4%	95,581	89.3%	84.4%	74,907	86.5%	81.6%
Black Alone	8,354	0.7%	0.9%	2,045	1.9%	3.0%	1,571	1.8%	2.4%
AIAN Alone	2,698	0.2%	0.3%	287	0.3%	0.4%	220	0.3%	0.3%
Asian Alone	15,803	1.3%	1.3%	2,470	2.3%	2.2%	3,339	3.9%	4.1%
Two or More Races	11,606	0.9%	1.8%	1,503	1.4%	2.6%	907	1.0%	2.6%
Hispanic or Latino	20,489	1.7%	2.5%	4,944	4.6%	7.6%	5,388	6.2%	9.8%

According to the 2000 U.S. Census, racial and ethnic minority groups in Manchester make up 10.7 percent of Manchester's total population and represents 18.9 percent of all racial and ethnic minority populations in NH.

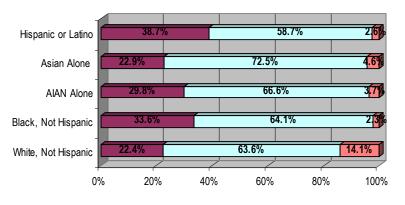

- Manchester has 24.5% of the State's Black and African American population.
- Manchester has 24.1% of the State's Latino population.
- Manchester has 15.6% of the State's Asian population.
- Manchester has 10.6% of the State's American Indian and Alaska Native (AIAN) population.

Now more than ever, government, community leaders, and residents need to understand our changing community, the strengths it brings and the potential obstacles as the population grows.

In Manchester, the 'Black or African American Alone' population makes up almost 2 percent of the total population, however Black children under 18 years old make up 3.0 percent of all children in Manchester. The 'Hispanic or Latino' population makes up 4.6 percent of the total population, however Latino children under 18 years old make up 7.6 percent of all children in Manchester. In Nashua, Latino children under 18 years old make up almost 10 percent of all children in Nashua. Also, Asian children make up 4.1 percent of all children in Nashua.

The current and continuing increase in racial and ethnic diversity in younger generations inevitably impacts the present as well as the social, educational, political, and economic future.

In order to ultimately enrich the dialogue about race and ethnicity in our community, we must understand the underlying social and economic factors that contribute to health disparities and undermine community health improvement efforts.

Age Distribution of Populations in Manchester, NH⁴

🔲 Under 18 Years 🔲 18-64 Years 📕 65 Years & Over

Because resources can be pooled in households, household structure influences an individual's economic well-being. Changes in household structure may influence and be influenced by economic status. For example, child poverty is higher in single-parent families, and as the wealth of older persons increased, they become more likely to head their own households.

- The percentage of NH racial and ethnic populations living in married-couple families range from 40.3 (Blacks), 43.5 (American Indians and Alaska Natives), 49.2 (Latinos), 55.5 (White, Not Hispanics), to 61.4 (Asians) percent.
- Of 21,257 White children under 18 years of age living in Manchester, 66 percent live in married families and 28 percent live in single parent families.
- Of 738 Black children living in Manchester, 39 percent live in married families and 50 percent live in single parent families.
- Of 92 American Indian and Alaska Native children living in Manchester, 57 percent live in married families and 34 percent live in single parent families.
- Of 568 Asian children, 83 percent live in married families and 11 percent live in single parent families.
- Of 1,900 Latino children, 45 percent live in married families and 41 percent live in single parent families.

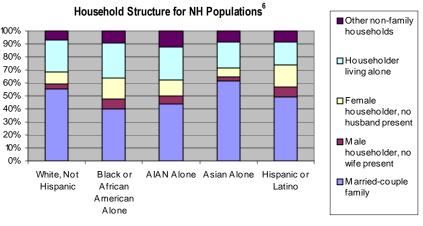

Differences in age distribution between population groups reflect differences in death rates, fertility rates, rates of net immigration, and the age of immigrants. In Manchester, NH:

- The 'White Alone, Not Hispanic' population is, on average, older than other groups. Less than 25 percent of White, non-Hispanics are under the age of 18, compared to 33.6 percent in Blacks and 38.7 percent in Latinos. The school-aged population is more racially and ethnically diverse than the population as a whole.
- According to the 2000 U.S. Census, the median age for the Asian population was 29.4 years and 31 years for the American Indian and Alaska Native population. The median age of 'Black or African American Alone' population was 25.4 years.⁵
- Even younger still, the median age of the 'Hispanic or Latino' population was 23.7 years, more than 11 years younger than the median age of the total population (34.9 years) and 12.6 years younger than the 'White Alone, Not Hispanic' population (36.3 years).⁵

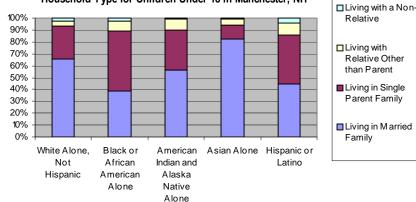

These age differences contribute to differences in economic, health, and social status across racial and ethnic groups.

Since minority populations are largely made up of people under 64 years of age, it is difficult to currently see manifestations of chronic disease in these younger populations. However, this current age distribution holds significant implications for the future medical care of these Manchester residents.

Also, younger populations have the potential to augment the labor force as baby-boomers retire over the next several years, if resources are dedicated to enhancing skills and education.

II. Labor Markets:

Earnings from the labor market are the primary source of income for the majority of families. Factors like labor force participation. the unemployment rate among labor force participants, the number of hours worked per year, and hourly wage rates determine labor market earnings. Determinants of employment include educational attainment, skill set and training, navigation of employment networks, and family legacy.

- . Black, Asian, and Latino men and women have significantly less overall earnings than their White counterparts, according to 2000 Census estimates.
- Between racial and ethnic groups for males and females, median earnings were significantly different.

The labor force participation rate is the percentage of the population that is either employed or actively seeking work.

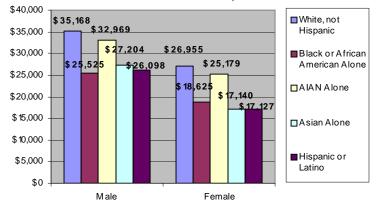

- In general, labor force participation rates are usually higher for men than women but, in Manchester, the female labor force participation rates are comparable to, if not surpassing, their male counterparts.
- Participation among women is often seen as an indicator of women's economic independence or, alternately, as a response to family financial stress resulting from being the sole provider in a single parent household or low male wages or unemployment.
- Latino men participated in the labor force at a rate that is consistent with that of White, non-Hispanic men.

The unemployment rate is a widely reported indicator of labor market distress. It is the percentage of the labor force without a job but actively seeking work. Persons who are not employed but not seeking a job are not included in the labor force and are therefore classified as neither employed nor unemployed.

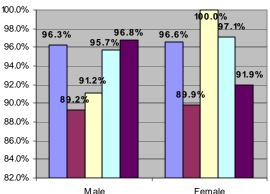

- In Manchester, the average annual unemployment rates for male and female White residents were a little over 3 percent.
- The average annual unemployment rates for Black residents were just over 10 percent.
- Unemployment estimates for Latino men were consistent with that of White, non-Hispanic men.
- Unemployment rates for Asian and American Indian men were 4.3 and 8.8 percent respectively.

(Unemployment 2000 Census estimates reviewed were by place of residence and not seasonally adjusted.)

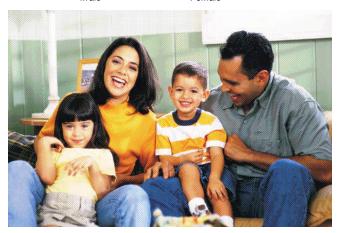

Median Earnings in 1999 (Dollars) for the Population 16 Years and Over in Manchester, NH⁸

Percent of Civilians Age 16 and Over Active in Labor Force in Manchester, NH⁹

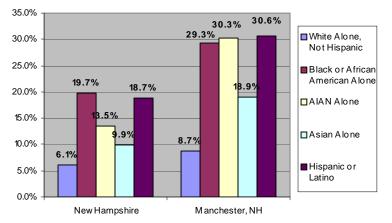

III. Economic Status:

No single indicator can adequately capture all facets of economic status for entire populations, but measures such as median or average annual income are the most often used. The economic status of most individuals, especially children, is better reflected by the pooled resources of family or household members than by their individual earnings or income. Therefore, median annual family income is a commonly used indicator of current family economic status.

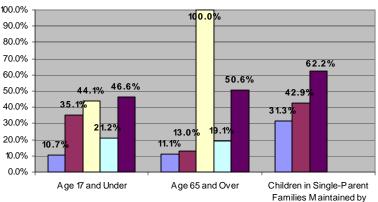

Factors contributing to differences in family income include educational attainment, unemployment rates, and wage rates. Non-Hispanic White families have much higher median incomes than Black or Latino families. Nationally, the median income of Black families as a percentage of the median family income of White families was about the same in 1997 as in 1967, at less than 60 percent. Latino median family income has fallen in absolute terms (and relative to that of non-Hispanic Whites) since 1972, in part due to the increasing representation of immigrants in the Latino population.²³

 Locally, median family income estimates show considerable differences in Black and Latino family incomes compared to White, American Indian, and Asian families. The lower incomes for most groups in Manchester suggest that factors specific to a place of residence within the state impacts income.

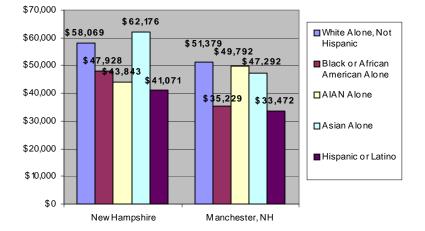

Percent of Selected Populations with Income Below Poverty Level in 1999¹¹

Poverty Rates by Selected Individual Characteristics in Manchester, NH¹²

Females

Median Family Income (Dollars) in 1999¹⁰

Half of all Manchester's Latino children and one third of Black children are living below poverty or growing up in poverty.

Differences in median incomes provide only a partial description of differences in the income distributions of groups. The poverty rate, a widely used indicator of economic disadvantage, measures the proportion of a population whose cash income is below the official poverty line. The poverty line is adjusted for family size. In 2000, the poverty line for a family of four was \$17,050. In 2004, the poverty line for a family of four was \$18,850.

 At the state and local level, the poverty rate for non-Hispanic Whites remains well below that of all racial and ethnic groups.

The increase in Latino poverty is partly the result of the lower educational and economic attainment of many Latino immigrants. Some of the disparities in poverty rates between racial and ethnic groups can be explained by differences in factors such as age distribution, family structure, and educational attainment.

However, substantial differentials between groups exist even among individuals with similar characteristics. Poverty among children is of particular concern. Child poverty not only reflects current economic hardships among poor families with children, but it is also associated with inequality of opportunity, higher risk for poor child health and delayed cognitive development, and a predictor of long-term economic disadvantage and adulthood poverty.²³

 In Manchester, Black, American Indian, Asian, and Latino children have significantly higher rates of poverty, 35.1, 44.1, 21.2, and 46.6 percent respectively, compared to White, non-Hispanic children at 10.7 percent.

Although child poverty rates exceed overall individual poverty rates, differences between racial and ethnic groups in child poverty mirror those in overall poverty.

- For example, poverty rates among the elderly are higher among all other racial and ethnic groups than among Whites.
- Similarly, although poverty rates are relatively high for all children in single-parent families maintained by women, they are considerably higher for Latino (62.2 percent) and Black children (42.9 percent) than for White children in such families (31.3 percent).

The higher poverty rates of Black and Latino residents are in part related to educational attainment, the age distribution, and the prevalence of single-parent families for those groups. However, even among individuals with similar characteristics, poverty rates are higher for Blacks and Latinos than for Whites. Lower wages and higher unemployment play a role in these differences.

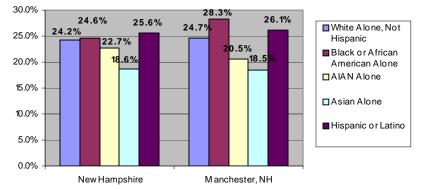

IV. Housing and Neighborhoods:

The housing in which people live and the neighborhood where they reside may affect a variety of opportunities for children and adults. Poor housing may contribute to a number of adverse health and educational outcomes, particularly in children. The Institute of Medicine describes the physical environment as "affecting children's health by exposing them to a wide variety of external conditions. These include chemical, biological, and physical influences that exert their impact by being taken into the body (i.e. lead and persistent organic pollutants) or interact-ing with the body surfaces (i.e. ultraviolet light, physical abuse, particulate matter in air pollution) or the senses (i.e. noise and odors). The built environment affects the ways in which children are differentially exposed to some of these influences. Exposure is the sum of all exposure factors over the course of time, including the home, school, child care, and play areas." ²⁵

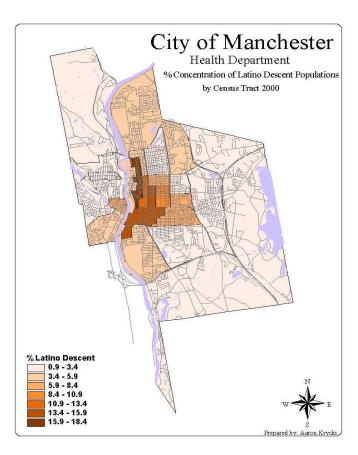

An individual's neighborhood is related to the availability and quality of important amenities such as a safe environment, primary education and other public services, as well as economic opportunities. Growing up in neighborhoods with concentrated poverty, high crime, and public schools with limited resources is associated with poor educational outcomes and may reduce chances in adulthood. Neighborhood quality, like physical housing conditions and the quality of associated services, varies considerably depending on a transient renters' market and the racial and ethnic composition of the population.

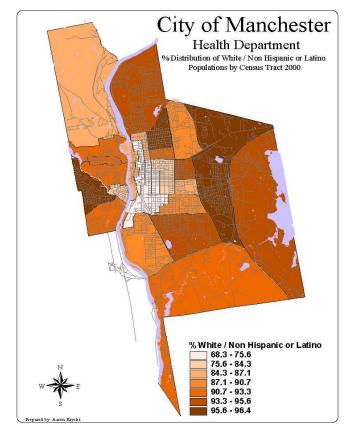

- In Manchester, over 25 percent of Black and Latino household incomes go toward the monthly rent.
- There are also marked differences between the median rental prices that each population pays that are inconsistent with where poorer minority residential areas are clustered.^{13,14}

Median Gross Rent as a Percentage of Household Income in 1999¹³

As an old mill town, separated by a river, 77 percent of Manchester's housing units were built prior to 1980. The City was originally designed around a privy system and multi-dwelling three story "flats," creating modern-day center city neighborhoods with tight alley ways, one way streets, very few sidewalks, and virtually no green space. In addition, close to 44 percent of the housing units were built prior to 1950, leaving an entire center city population at risk for lead poisoning exposure. In some areas, the quality of the housing stock is extremely poor with burdening issues such as a lack of adequate plumbing and heating and safe places to play. For example in 2000, 12.4 per 1000 children under the age of 6 years old had elevated blood lead levels greater than or equal to 10 ug/dl in Manchester compared to a rate of 3.4 per 1000 children throughout the rest of New Hampshire.²⁵

Neighborhoods have long been segregated by race. Because neighborhoods have historically been segregated, public services and other amenities associated with neighborhoods have also been unequally distributed. In addition, the racial and ethnic composition of neighborhoods can play an important role in determining how much interaction individuals have with members of other minority groups. As depicted in the two maps on the previous page, members of Latino populations live disproportionately with White, non-Hispanic populations in Manchester.

Manchester's center city neighborhoods hold the greatest population density compared to any other geographic area in the State.

 Nearly 33 percent of Manchester's children live within 200% of poverty level with some neighborhoods reaching poverty levels up to 90%.²⁵

Among the poorest Census Tracts (4.00, 5.00, 14.00, 15.00, and 20.00) -

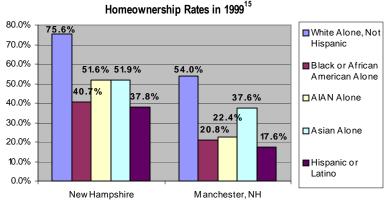

- 24.4% of Manchester's' Hispanic or Latino' population reside in the poorest census tracts or neighborhoods.
- 24.1% of Manchester's 'Black or African American Alone' population reside in the poorest census tracts or neighborhoods.
- In contrast, 8.1% of Manchester's 'White Alone, Not Hispanic' population reside in the poorest census tracts or neighborhoods.

For the Weed and Seed Designated Target Area (Federally sponsored by the U.S. Department of Justice and locally by the U.S. Attorney's office) that covers Census Tracts: 13.00, 14.00, 15.00, 16.00, 18.00, and 19.00 -

- Over 50% of the most violent crimes occur within center city, and there are nearly 2,500 unduplicated calls for service for domestic violence each year.²⁵
- 48.8% of Manchester's 'Hispanic or Latino' population reside in the Weed and Seed Designated Target and Area.
- 32.3% of Manchester's 'Black or African American Alone' population reside in the Weed and Seed Designated Target Area.
- In contrast 18.3% of Manchester's White Alone, Not Hispanic' population reside in the Weed and Seed Designated Target Area.

The federally designated Medically Under-served Areas (MUA) fall within Center City and the Weed and Seed Designated Target Area. Within the medically underserved area of the City, two thirds of households report total incomes of \$25,000 or less.²⁵

As a contributor to the stability of neighborhoods, homeownership is an indicator of financial well-being. The homeownership rate is the percentage of householders that own their own homes.

- In Manchester, the homeownership rate of White, non-Hispanics is more than 30 percent above that of Blacks, Asians, and Latinos.
- There is only about 1 in 5 Black homeowners and only about 18 percent Latino homeowners.

The 1968 Fair Housing Act prohibited discrimination on the basis of race or ethnic origin in housing and mortgage lending. Still, segregation remains high. And continued discrimination in housing and mortgage lending has been clearly documented through audit studies, in which similar White and minority candidates attempt to rent apartments or apply for home mortgage loans. One national study found that the incidence of unfavorable treatment in the housing market was 23 to 30 percentage points higher for a Black or Latino applicant compared with his or her matched White counterpart.²³

V. Enabling Factors

Education:

Educational attainment is one of the most important indicators of lifetime economic opportunities. Higher educational attainment is associated with lower unemployment and higher wages, higher family income, and better health for adults and their children. A substantial portion of gaps in well-being among racial and ethnic groups can be accounted for by differences in educational opportunities and attainment. Black, American Indian, and Latino children are more likely than White or Asian children to experience educational disadvantages. These children are more likely to be poor and to have parents with lower education levels. As a result, they often begin life with disadvantages related to family financial and educational resources as well as the ability to navigate career networks.

	White Alone, Not Hispanic % of Population	Black or African American Alone % of Population	AIAN Alone % of Population	Asian Alone % of Population	Hispanic or Latino % of Population
Total	65,625	1,288	162	1,507	2,267
Less than 9th Grade	7.1%	10.0%	14.8%	16.5%	17.2%
9th to 12th Grade, No Diploma	11.1%	14.5%	4.9%	12.7%	24.7%
High School Graduate (Includes Equivalency)	31.0%	27.5%	37.0%	13.3%	29.5%
Some College, No Degree	20.0%	26.0%	5.6%	10.5%	14.9%
Associate Degree	8.4%	2.7%	10.5%	7.5%	4.4%
Bachelor's Degree	15.6%	12.9%	17.9%	18.2%	5.1%
Graduate or Professional Degree	6.8%	6.4%	9.3%	21.4%	4.2%

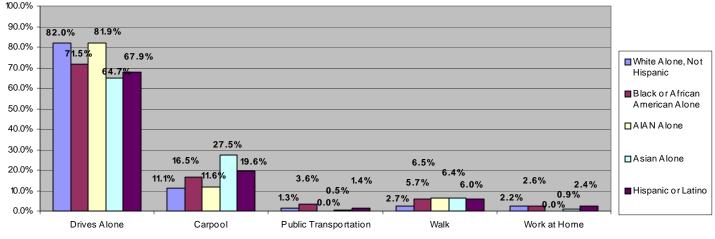

- There are over 1,600 students enrolled in "English as a Second Language" (ESL) classes with over 70 different languages being spoken as first languages in the Manchester public school system.²⁵
- According to the 2000 U.S. Census, almost 25 percent of Blacks, 30 percent of Asians, and 42 percent of Latinos aged 25 years and over have not completed high school or its equivalency compared to 18.2 percent of White, non-Hispanics in Manchester.
- Nonetheless, the fraction of the population aged 25 and older that completed high school and/or further education exceeded 50 percent for all five groups and is higher than 75 percent for Whites, Blacks, and American Indians.
- A significant number of Whites (20%), Blacks (26%), and Latinos (15%) report having had some college education, but do not have a degree.
- For Blacks, 22 percent have an advanced degree beyond high school compared to 30.8 percent of Whites.
- Only 12.8 percent of Latinos have an advanced degree beyond high school.
- Of 37.7 percent of American Indians with an advanced degree, 9.3 percent have a graduate or a professional degree. Of 47.1 percent of Asians with an advanced degree, 21.4 percent have a graduate or a professional degree.

Transportation:

Members of racial and ethnic populations, particularly recent immigrants, struggle to fulfill work and family commitments due to a lack of transportation. According to the 2000 Census, 19.9 percent of Black, 13.8 percent of American Indians, 12.9 percent of Asians, and 13.5 percent of Latino households in Manchester do not have a vehicle available, compared with 10.7 percent of White, non-Hispanic households.¹⁷

- Many people carpool together, 27.5 percent of Asians and 19.6 percent of Latinos carpool to work.
- In Manchester, more people opted to walk to work than to use public transportation.

Immigration Status:

The population of Manchester is becoming increasingly diverse. People of different races, nationalities, political and economic backgrounds come in search of better educational and work opportunities, to have a better quality of life and a safer, healthier environment in which to raise their families.

2.9%

Alone

A majority of Black and Latino Manchester residents are born in the U.S. or naturalized citizens. Only 28.3 percent of Black and 20.5 percent of Latino residents are non-U.S. citizens.

Those without legal documentation can be reluctant to access government services for themselves or their children due to a general fear and distrust of immigration authorities.

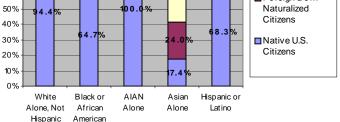

- According to the 2000 Census, 26.6 percent of 1,852 Spanish-speaking households in Manchester were considered 'linguistically isolated.' A linguistically isolated household is one in which no member 14 years old and over: (1) speaks only English or (2) speaks a non-English language and speaks English "very well." In other words, all members 14 years old and over have at least some difficulty with English.²⁰
- Of households that speak Asian and Pacific Island languages, 37.9 percent of households surveyed are 'linguistically isolated.' Of households that speak Indo-European languages, 14.0 percent of households are 'linguistically isolated.'

Latino, Eastern European, Asian, and other foreign-language populations have dramatically increased with very few bilingual staff available in most health and human service organizations. Most of these families will struggle to navigate through traditional primary care and treatment service systems when the majority of their conditions could have been prevented.²⁵

100% 27 90% Foreign Born 80% Non-U.S. Citizens 70% 60% Foreign Born Naturalized 00.0% 4 4 77 Citizens 8.3%

Place of Birth by Citizenship Status for Manchester, NH¹⁹

Since the early-1980s more than 5,000 refugees, who have fled their countries of origin for fear of persecution and death, have made New Hampshire their home. Refugees come to New Hampshire from more than 30 different nations and represent a diverse group of ethnic minorities. Many eventually become naturalized U.S. citizens. Most of New Hampshire's refugees live in Hillsborough County, with significant resettlement also being carried out in the Concord, Franklin, and Laconia areas. Refugees have greatly contributed to our state and local communities. Through their hard work they have strengthened our economy and their presence has enriched the cultural diversity of New Hampshire. (Http://nh.gov/oep/programs/refugee/index.htm)

Government, community leaders, and residents need to understand our changing community, accommodate the diversity it brings, and anticipate potential obstacles as the population grows.

Access to Health Care:

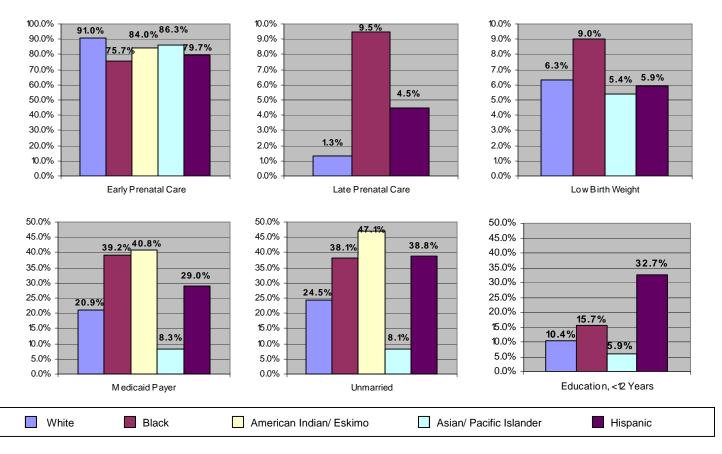

Advances in public health practice and medical technology have contributed to dramatic improvements in the longevity of the U.S. population. On average, Americans in the 1900's could not expect to live to the age of 50. Although all racial and ethnic groups have experienced gains in life expectancy, differences between groups in longevity and in many other measures of health status have been apparent for as long as these measures have been collected separately by race. This is true for measures of health status at the beginning, middle, and end of the life span.²³

Disparities in health status have economic consequences throughout other community systems as well. Poor health can lead to high expenditures on medical care at the expense of other goods (for example, housing or education). Perhaps more important, poor health can also reduce earning potential and lower quality of life. Thus, the disparities observed in health between racial and ethnic groups are tied to differences in many other economic and social realms.²³

Strong predictors of access to quality health care include having health insurance, a higher income level, and a regular primary care provider or other source of ongoing health care. Use of clinical preventive services such as early prenatal care, serves as one national indicator of access to quality health care services.

New Hampshire Birth Characteristics by Race and Ethnicity, 1999-2000 Combined²¹

Note: Rates based on fewer than 20 births do not meet standards of reliability or precision and are not reported.

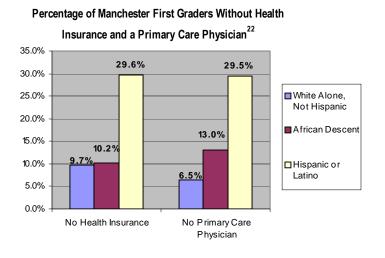

Demographic and socioeconomic factors are associated with a woman's health and health behaviors during pregnancy and may influence birth outcomes, especially when taken all together. Among the important predicting social factors are age, income, marital status, and education.

- Differences in prenatal care history between races exist. The percentage of births with early prenatal care was significantly less for Black mothers when compared to White and Asian mothers. Among Black women, there were significantly: more births to women who obtained late prenatal care, more births to women who were unmarried, more births to women with less than 12 years education, and more births to women enrolled in Medicaid for the payment of prenatal care and/or delivery expenses.
- Available data on the small number of births to American Indian women indicates fewer mothers who obtain early prenatal care and more births to women who are unmarried and enrolled in Medicaid.
- The number of births to Latino mothers has increased in NH over time. Among all racial and ethnic groups, Latino resident births were the second largest group (after Whites) in NH in 1999 and 2000. There were significant differences between the maternal behaviors and characteristics among births for Latino mothers when compared to White mothers and, especially, Asian mothers who may have similar immigrant experiences. Among Latino mothers, there were significantly: more births to women who obtained late prenatal care, unmarried, had less than 12 years education, and enrolled in Medicaid for the payment of prenatal care and/or delivery expenses.

In addition to looking at trends in early prenatal care for pregnant women, the federal Department of Health and Human Services also recommended in their Healthy People 2010 national objectives two additional indicators to assess access to health care. These included looking at the proportion of persons with health insurance and those who have a specific source of ongoing care. Coverage by health insurance, either private or public (for example, Medicaid), is a key indicator of access to medical care, because it provides a channel to directly obtain medical services. Persons with health insurance are more likely to have a primary care provider and to have received appropriate preventive care such as early prenatal care or immunizations, but many do not have a particular doctor's office, clinic, health center, or other place where they regularly go to seek health care or health-related advice. Adults with health insurance are twice as likely to receive a routine checkup than adults without health insurance.

Financial, structural, and personal barriers can limit access to health care. Financial barriers include not having health insurance, not having enough insurance to cover needed services, or not having the financial capacity to cover services outside a health plan or insurance program. Structural barriers include the lack of primary care providers, medical specialists, or other health care professionals to meet special needs or the lack of health care facilities. Personal barriers include cultural or religious differences, language barriers, not knowing what to do or when to seek care, or concerns about confidentiality or discrimination.

- Latinos are the most likely to be uninsured, and White, non-Hispanics are the least likely to be uninsured as evidenced by local school data of Manchester first graders. Both Black and Latino children surveyed indicated high percentages of being uninsured and having no primary care physician compared to White, non-Hispanic children.
- Obtaining health care coverage is a challenge for the Latino community. Many new immigrants arrive without health insurance and are employed in jobs that do not offer health insurance or, if insurance is offered, it is too expensive. For many Latino immigrants, the U.S. health care system is difficult to navigate, the concept of health insurance and the role of public programs is confusing, the cost of coverage is high and fear exists related to immigration status.

Acknowledgements

The preparation of this report card was sponsored through the financial support of the Centers for Disease Control NH REACH 2010 Initiative (Racial and Ethnic Approaches to Community Health) and the City of Manchester Department of Health.

The mission of the NH REACH 2010 Initiative is to improve the health status of African Descendent and Latino communities in New Hampshire, through research, education, and outreach, with a focus on diabetes and hypertension. REACH 2010 is a national program of the Centers for Disease Control and Prevention (CDC) as part of the Healthy People 2010 Initiative. Healthy People 2010 has two overarching goals: (i) to increase quality and years of healthy life; and (ii) to eliminate health disparities.

This report was prepared and submitted by Audrey M. Chan, MPH, a research analyst for the Manchester Health Department on September 2004. For more information or copies of this report card, please contact the City of Manchester Health Department Public Health Assessment and Planning at (603) 624-6466 or Http://www.manchesternh.gov/CityGov/HLT/Home.html.

Tabular Appendix

The tables presented in this Appendix offer extensive detail on the range of topics covered in the narrative portion of this report. The asterisks (*) in many of the cells in these tables represent frequencies that are too small to support stable rates and are thus not reported.
